

**Access Methods for  
Mobile Marketing**

# Why?

- Timely and context-specific content is of no use if users don't know how to access it
- CliqTags therefore supports a plethora of mobile-friendly access methods

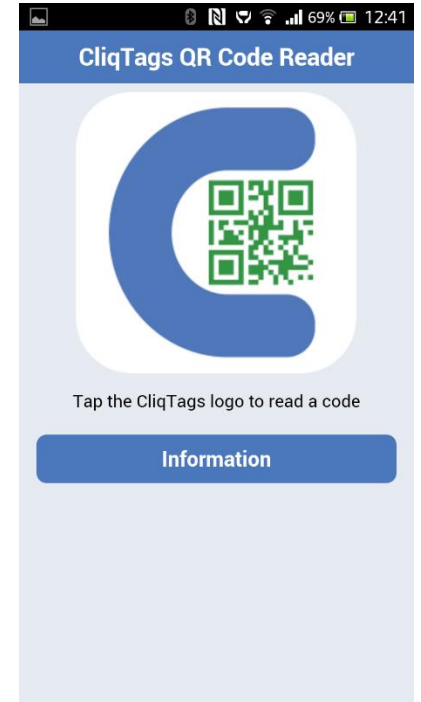

# What?

- CliqTags is a content management system optimized for quickly creating and managing mobile sites, for the purpose of context-based marketing and information
- Sites are accessed via a unique short link
- That being the case, almost any access method works
  - QR codes, Snapcodes, NFC tags, SMS requests, bulk SMS, bulk e-mail, beacons, geofencing, wrapper apps etc, in any combination

# QR Codes

- Many recognize and know how to use them
- iOS and most Android phones support QR codes via the camera app
- They don't add cost to printed work
- Important with a call-to-action message, so it's clear what's accessed via the QR code
- It's possible to use different colors, overlay an icon etc, to spice them up a bit
- Free apps can be used, e.g. CliqTags QR Code Reader

# Snapcodes

- Many younger people have the Snapchat app installed, and use it daily
- Scanning Snapcodes is supported by the Snapchat app for iOS and Android
- Snapcodes with URLs can be created via the app or (better) via <https://scan.snapchat.com/>
- Snapchat also scans standard QR codes with URLs

# NFC Tags

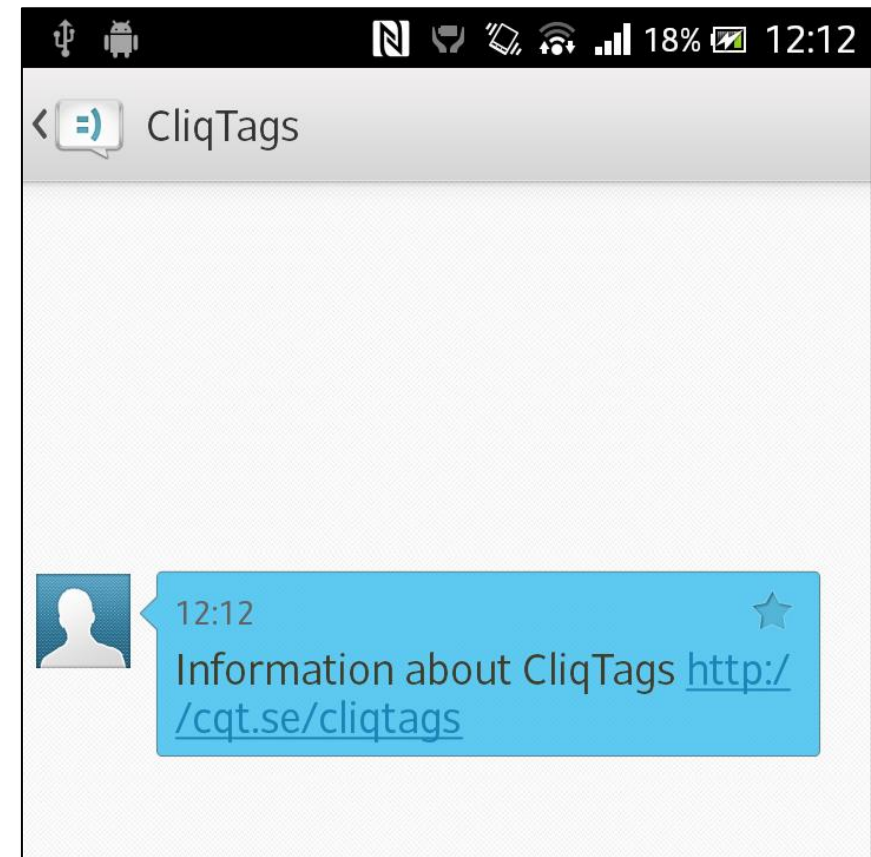

- NFC tags are subtle, as they don't have to be visible to work
- Also here a clear call-to-action message is needed
- More expensive to deploy than e.g. QR codes
  - yet sub \$ in volume
- Can be write-protected to avoid tampering
- Native support in Android and iOS
  - iOS since version 14 and iPhone 7
- CliqTags NFC Writer makes creating CliqTags-compliant NFC tags very easy

# Bulk SMS and E-mail

- Sent from within CliqTags per site or via CliqTags Messaging that provides more features
- Site name and link are automatically inserted, but also other information can be provided
- The same message can be sent to any number of destinations
- You top up funds for sending SMS

# SMS Requests

- SMS is supported by all phones, so this is a good fallback method
- The user sends a keyword and a site ID to a short number
- The user gets an SMS containing the name of the site and a clickable link for easy access
- The received SMS remains as a reminder for later accesses
- This is set up on request

# Beacons

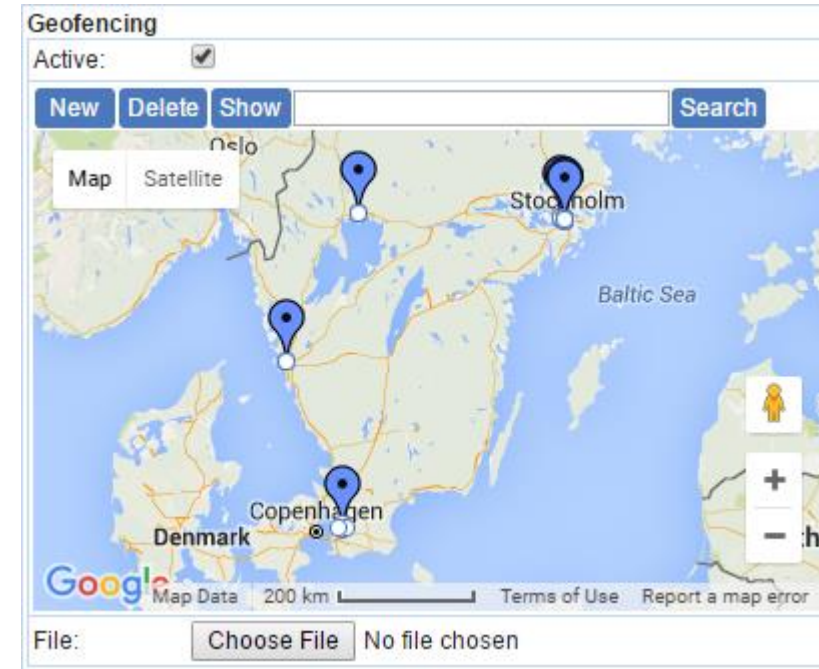

- Bluetooth Smart/LE beacons signal place/ context in shops, museums, conference centers, airports etc
- iBeacon:
  - Communicates a unique ID
  - CliqTags Spotter associates IDs with content at CliqTags
- Eddystone:
  - Communicates a URL (Eddystone-URL)
  - CliqTags Nearby supports Eddystone-URL

# Geofencing

- Smartphones use GPS, cell network or Wi-Fi to locate
- CliqTags Spotter utilizes that to determine in what geofencing zone the phone is and shows content if there's any for that location
- Multiple geofences can be set up per site, and they can overlap

# Facebook Page Tabs

- You can embed CliqTags sites on Facebook Pages as Tabs
- The principle is the same as for other Page Tabs, where the URL for the CliqTags site is given
- Works from PC or mobile

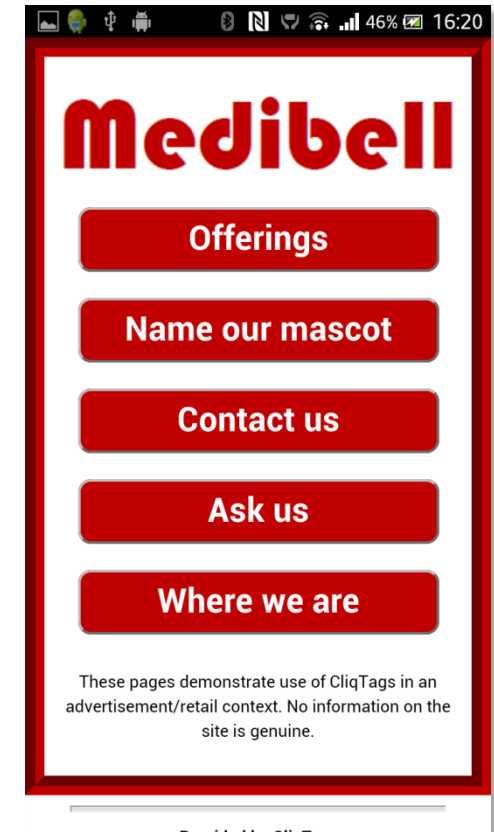

The screenshot shows a Facebook page for 'CliqTags' (@cliqtags). The page has a blue header with the Facebook logo and search bar. Below the header, there are navigation tabs: 'Sida', 'Meddelanden', 'Aviseringar', 'Statistik', 'Publiceringsverktyg', 'Inställningar', and 'Hjälp'. The main content area features a large image of a man and a woman in a store, with the 'CLIQTAGS' logo overlaid. Below the image, there are buttons for 'Gillar', 'Följer', 'Dela', and 'Kontakta oss'. On the left side, there is a sidebar with a list of tabs: 'Startsida', 'Inlägg', 'Demo', 'Videoklipp', 'Foton', 'Om', and 'Gillar'. The 'Demo' tab is selected, showing a preview of the CliqTags website. The website has a blue header with the 'CLIQTAGS' logo and the text 'Engaging Mobile Campaign Sites'. Below this, there are several blue buttons with white text: 'Introduction', 'News', 'Arguments', 'The Solution', 'Customer Values', 'Features', 'How to Use', 'Services', 'Contact Us', and 'Find Us'. At the bottom of the website preview, there is a copyright notice: '(c) 2017, Abiro. All rights reserved.'

# Digital Ads

- CliqTags sites can be accessed by clicking on ads on mobile sites or in apps
- The ad can stay the same, while the content is changed over time
- A tracking code can be added to tell where the access came from

Ad on a mobile page

# Redirection

- Redirect from PC sites by testing for mobile devices
  - E.g. for Wordpress there's a plugin for this
- Alternative to responsive design
- Also makes the mobile site focused on information relevant for mobile use

# Wrapper Apps

- CliqTags sites can be wrapped in Android and iOS apps
- That way users experience the exact same installation and starting procedure as for any full app
- Management of the content is still the same as for any other access method
- Wrapper apps are provided per site
- They support scanning barcodes and NFC tags as well as dictation

# Combinations

- E.g. in the same printed material you can use e.g. a QR code, an SMS request and a direct link
- That can be complemented with e.g. NFC tags and beacons, provided such can be added practically and economically

**CLIQTAGS**  
**Become Mobile In No Time With CliqTags!**

Access methods:

- QR Codes
- Bulk SMS
- SMS requests
- iBeacon
- NFC tags
- Augmented Reality
- Direct links
- Wrapper apps
- etc

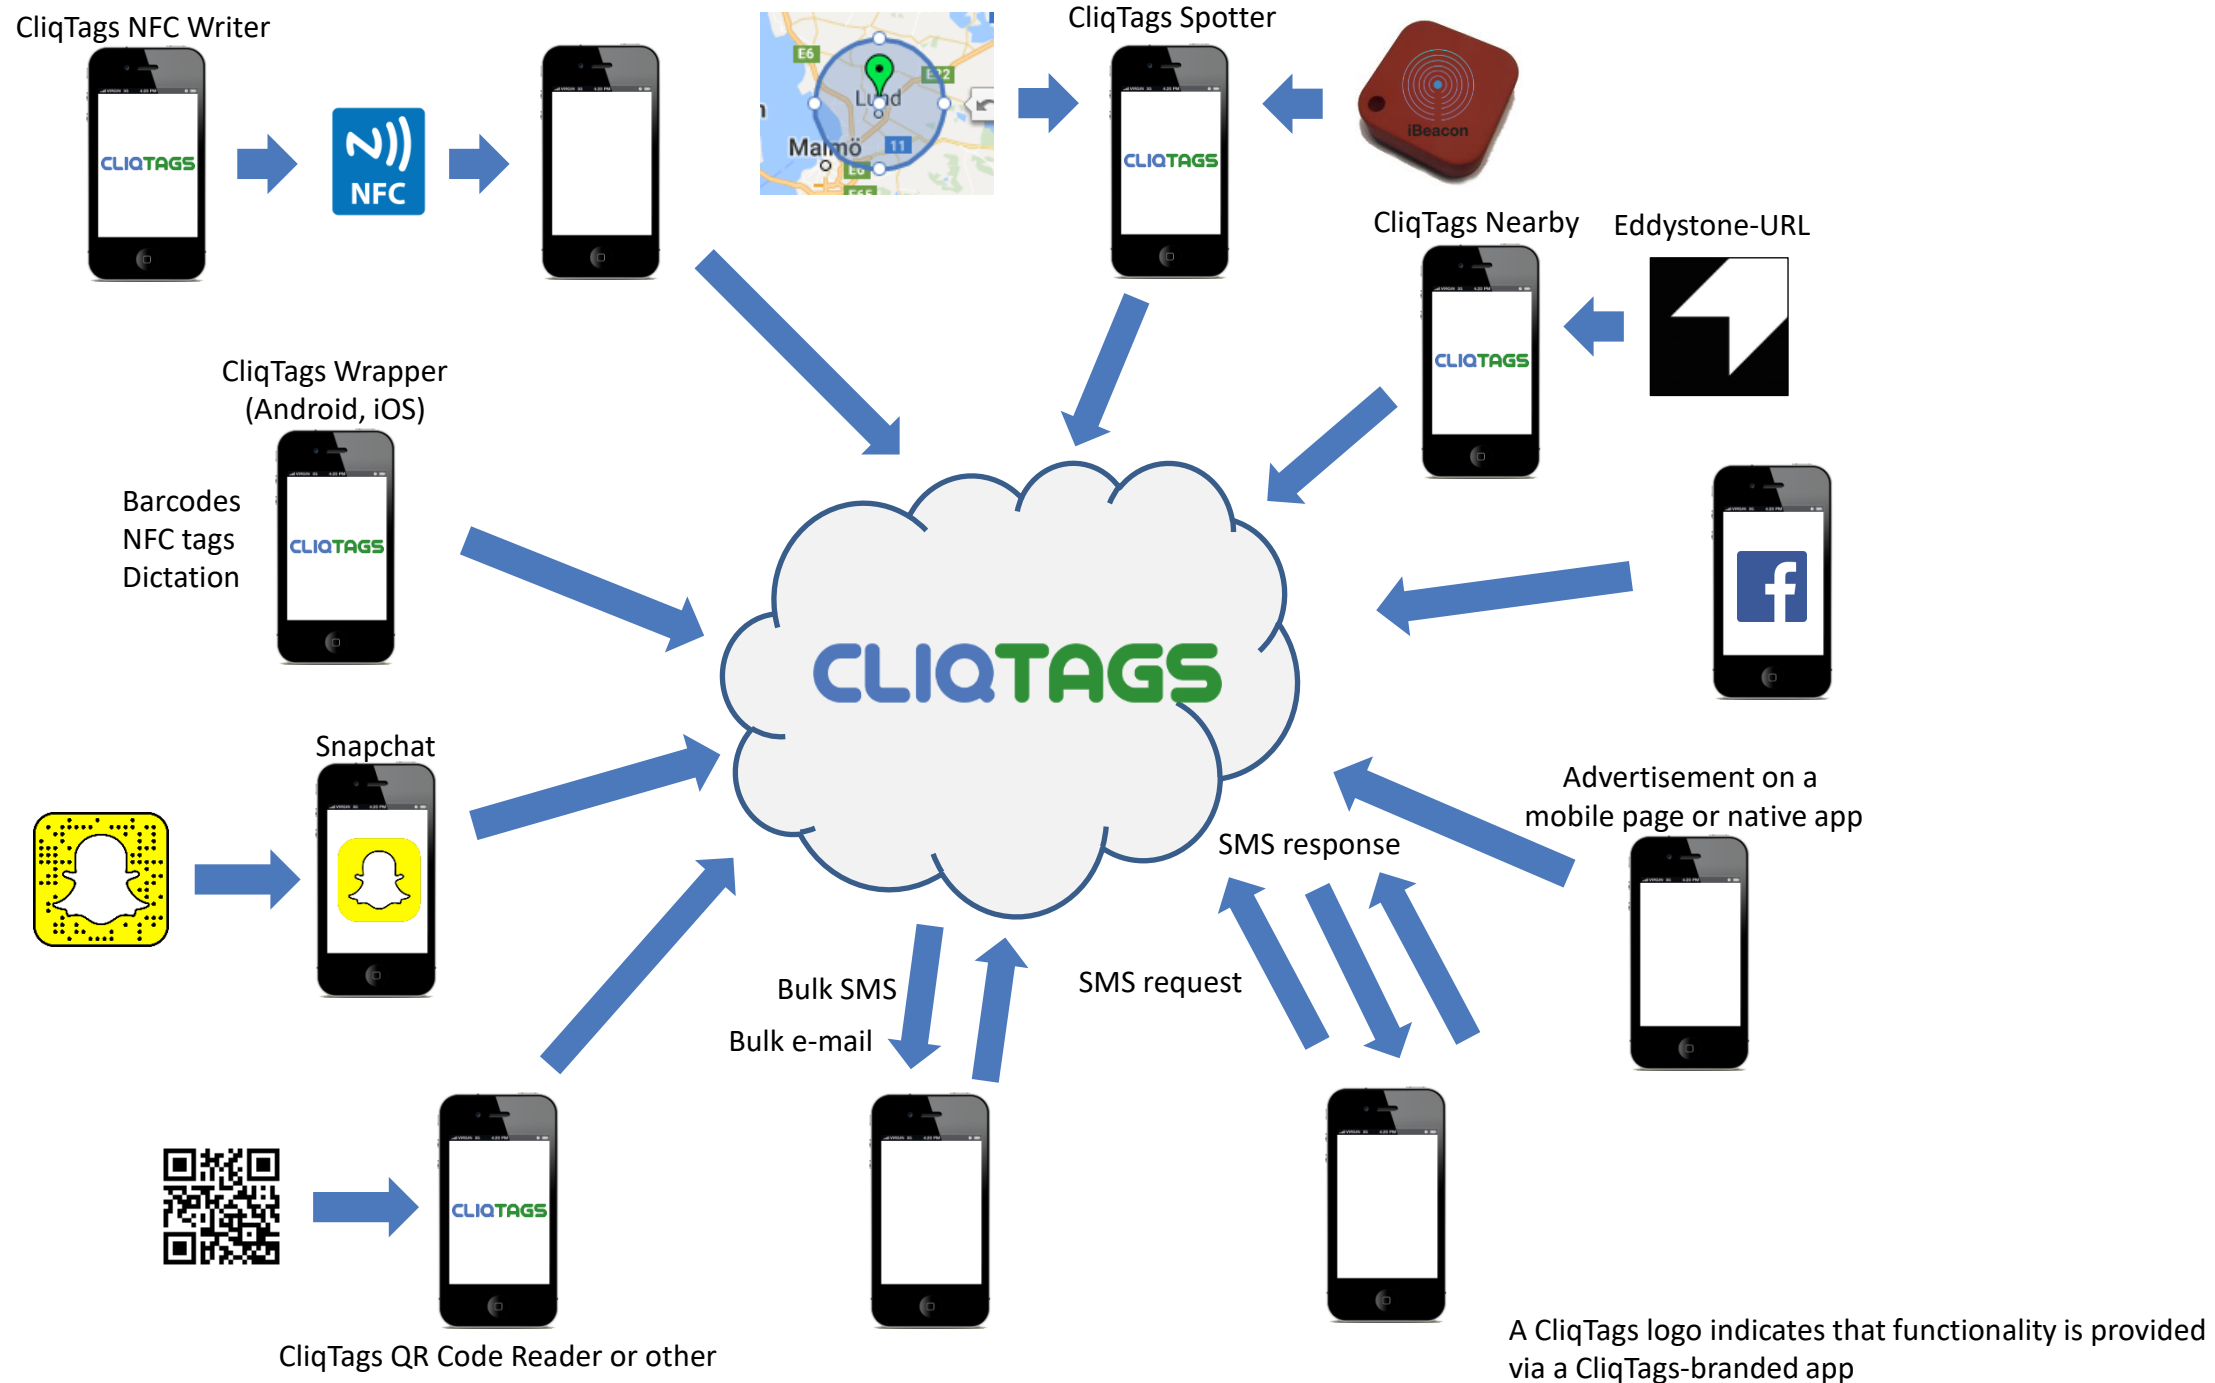

Company

Consumers

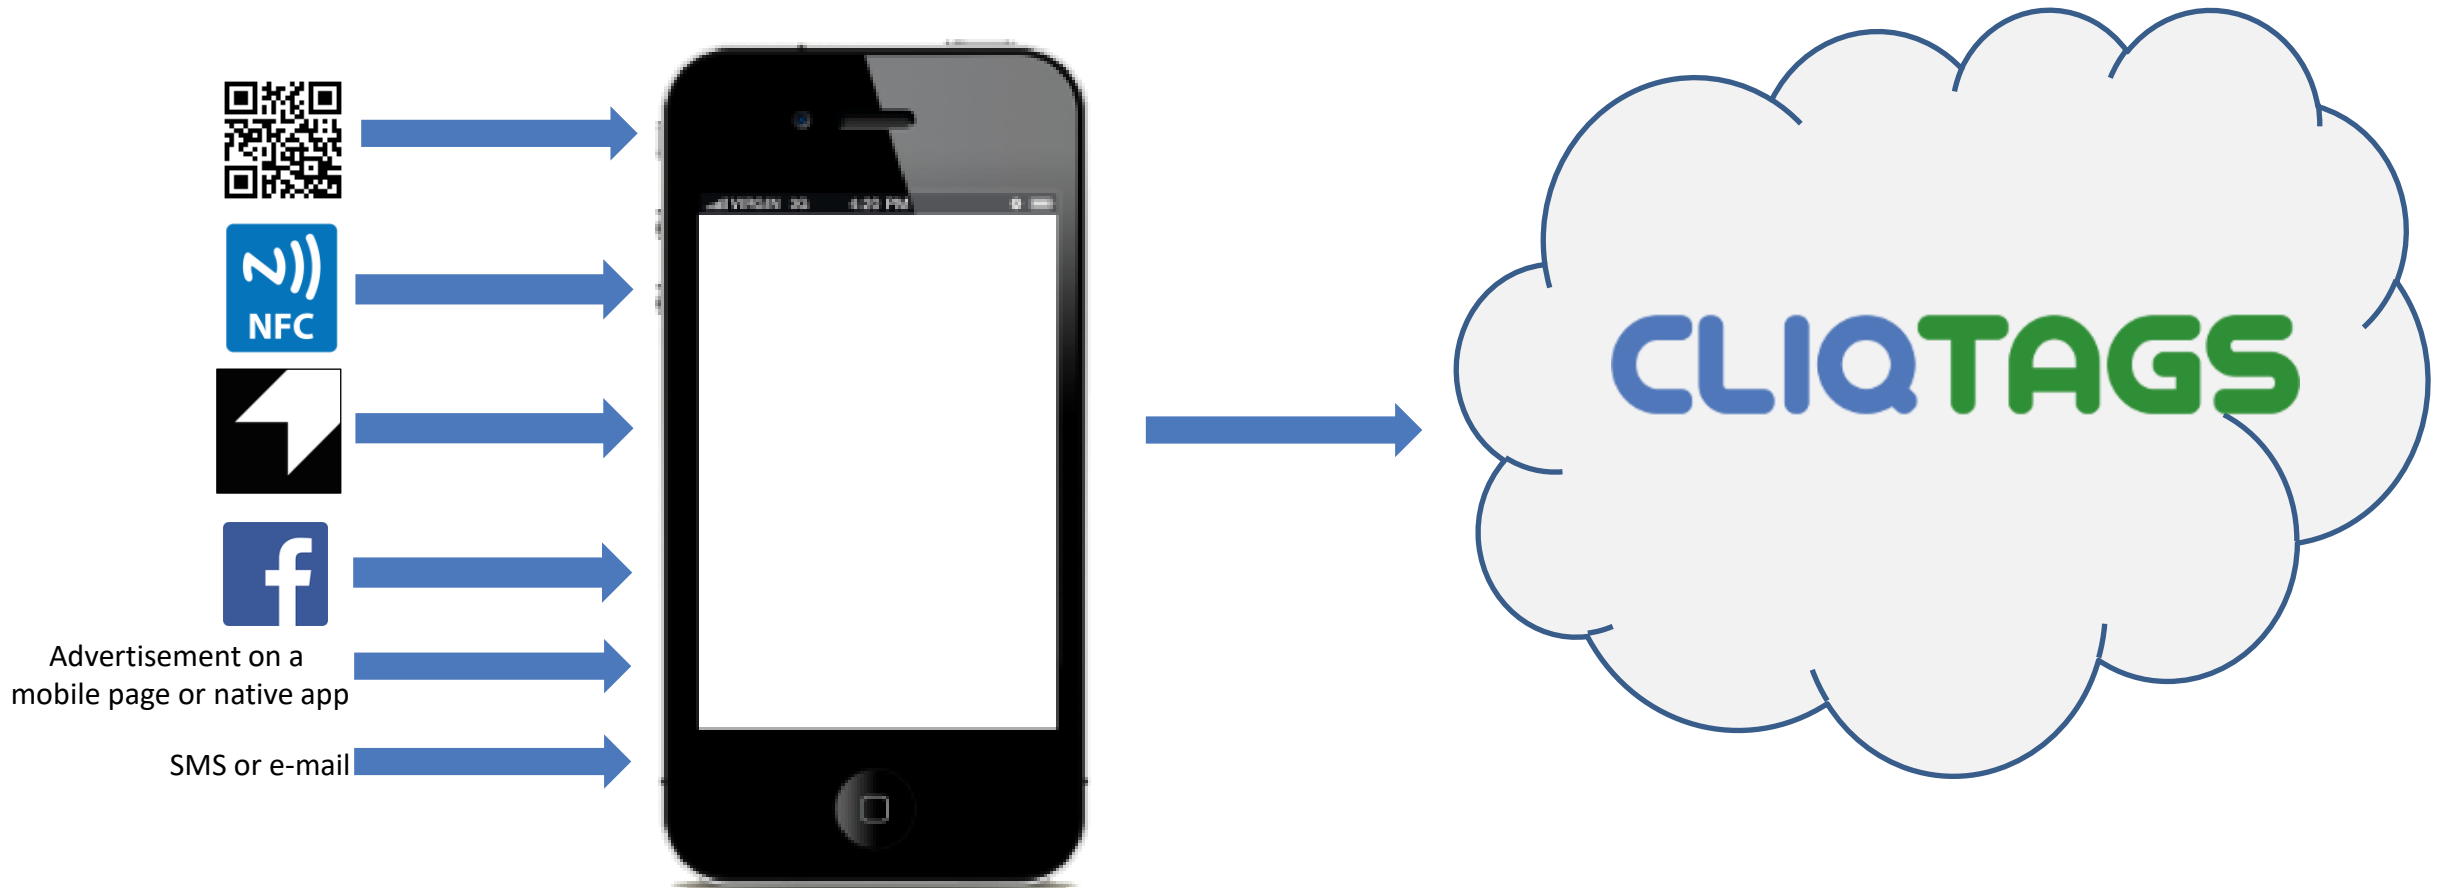

Functions:

- Create many sites
- Create many pages of different types, including interactive
- Create access methods
- Schedule content
- Detailed statistics
- etc

# App-less access

App-less = no custom app needs to be installed
